What are ATEX and IECEx?

The term **ATEX** (**AT**mosphère **EX**plosible) identifies the European Directive that went into force on 1st July 2003 and which establishes that all equipment installed inside the companies of all European Union states and located on premises with a potential explosion risk must conform to the specifications of the Directive in terms of safety (Ref. 94/9/EC and 99/92/EC).

The acronym **IECEx** refers to a certification that has the same characteristics as **ATEX** but applicable in Australia and New Zealand.

Industrial vacuums for areas at risk: knowing the zones and the risk categories

All areas at risk where industrial vacuums have to be used are divided into zones and risk categories are assigned to them; in other words, each company area is classified according to whether or not it contains flammable material. The customer tells the supplier of the industrial vacuum the zone where the industrial vacuum has to work and the category.

The following table gives the technical specifications of the industrial vacuums, clearly indicating the wide operating range offered by the **Nilfisk-CFM** range thanks to which it is possible today to work in maximum safety and in the most diversified working situations.

Laser technology

Potential causes of explosion

Hot surfaces (ex. overheating)
Sparks of mechanical source
Flames or hot gases (exhaust fumes)
Adiabatic compressions and pressure waves
Exothermic reactions (spontaneous combustion of dust)
Electrical material
Drifting and cathod protection electricity
Electrostatic charge
Lighting
Electromagnetic waves and radio-frequencies
Acoustic waves (ex. ultrasounds)
Optical radiations (ex. laser)
Ionizing radiations (ex. R-x)

Classification of areas with explosion risk

	Zone	Risk	Category
Gas	0	permanent	1G
	1	chance	2G
	2	rare	3G
Dust	20	permanent	1D
	21	chance	2D
	22	rare	3D
